

You can use the roobopri_4mic or roobopri_7mic to capture the mic array pcm data. These apps can save the pcm data to Tflash card every one hour.

The format of the file name is RB_FileIndexXXX_d_chnX.pcm. XXX is the number which increases one by one every one hour, and the X is the mic number in the mic array.

If the recording not above one hour, the temporary files're stored in /mnt/obb directory.

Notes

1. Regarding to the filesystem of the Tflash, we only support the FAT32
2. The last channel number is the reference data from playback path.
